

Backup In Business's Online Backup Manager ("PBUOBM") is multi-platform, feature-rich, reliable and secure client software for offsite backup of critical databases and files.

Data to be backed up is encrypted and compressed before it is sent to our server and storage infrastructure.

The Backup In Business's offsite backup software runs a daily fully automated offsite backup of your important files and data. This allows you to dedicate your valuable time to your business instead of your daily data backup.

After the simple installation of the software you select the files and/or directories with important data. You'll only have to do this the first time, but it's possible to change the selection later on when needed.

The first time a full offsite backup will be made from the selected files. After encryption and compression these are sent to the Backup In Business's offsite servers for save storage through a SSL (Secure Sockets Layer) connection.

From that moment on, a daily (incremental) backup will be made of all new and changed files.

After each backup you'll receive an e-mail notification with a detailed report of your backup. If the Backup In Business servers didn't receive your scheduled backup you'll be notified as well.

Your files will be stored twice at different remote locations to ensure that there's always a copy available 24 hours a day, 7 days per week.

Security is highly valued at Backup In Business so you won't have to worry about your valuable information. Your data is sent compressed and encrypted via a SSL connection to the highly secure datacenter where it's safely stored in duplicate (at 2 different locations). Every offsite backup user can limit the online access to his data to a predefined list of IP-addresses.

The encryption key which you generate yourself is only known by you and will never be sent through the internet. If you loose your encryption key your backup will be lost forever! The content of your backup is absolutely unreadable for Backup In Business despite the fact that Backup In Business has access to the encrypted files stored on our offsite storage or backup servers.

Always keep your encryption key in a save place!

Without the encryption key NOBODY will be able to restore your backup. This includes Backup In Business and the software developers!

To establish the secure connection Backup In Business uses a SSL connection. This protocol is similar to the one that banks use for online banking. Despite the fact that your data are submitted via the internet it's impossible for people who intercept it to read the content.
